

## Using the "Make a Table" Tool in DataFerrett

Note: These instructions use **Health Insurance** and **Rent Burden** as two examples of indicators that you can analyze with the "Make a Table" tool in DataFerrett. The **Health Insurance** indicator measures the percentage of people who do not have health insurance coverage, and the **Rent Burden** indicator measures the percentage of households that are rent burdened, meaning they spend more than 30 percent of household income on rent. For both of these indicators, we are comparing outcomes for different racial and ethnic groups.

- **Step 1.** Follow steps 1-9 in the DataFerrett section of CUNY ISLG's "Using American FactFinder and the DataFerrett" instruction document. You will launch DataFerrett, view variables in the American Community Survey Public Use Microdata Sample, and select the relevant Public Use Microdata Areas (PUMAs).
- Step 2. Next, you will want to select the correct weights. If you will be using person-level variables (e.g., Health Insurance), you will need the "PUMS person weight." If you will be using household-level variables (e.g., Rent Burden), you will need the "Housing Weight."

Selecting these will not weight the variables for you, they will just give you the option to weight them appropriately when using the data later, so it's fine to select both options. When you double-click on each of them, a new box will appear, and you will have to click the "Select" box and then click "OK" to add the variable to the dataset. A box will pop up letting you know that you have added the variable to your DataBasket (which just means your dataset).

Fowse/Select Variables & Values Your highlighted variables: ACS WGTP (2006 - ) Housing Weight	OK Cancel	Variable
Select ALL Variables		match A
0000) Group Quarter placeholder record	Deselect all values	219 Variables returne Availability Variable Label 2006 - current Housing Weight 2006 - current Age 2006 - current Age 2006 - current Ancestry categorization

- **Step 3.** Once you have added the appropriate weights, you can go through and select any relevant variables of interest in the same way that you selected the weights. This will include both the variables that you would like to use to disaggregate the data (e.g., race, gender, disability status) and your outcomes of interest. A few things to note:
  - You will have to select race and ethnicity variables separately.
  - If you want to look at person-level and household-level variables simultaneously (e.g., race and homeownership), you will need to select the RELP or "Relationship" variable.

This variable allows you to identify the person-level characteristics of the householder in each household.

If you want additional information about a variable, you can double-click on it and see the details about how it is coded. If it is a continuous variable (e.g., age), you can see information like whether there is a cut-off (e.g., 0 means under 1 year, while 99 means 99 or older – the variable is "top-coded") or a code for missing values. For categorical variables (e.g., race), you can also see what the different categories are. There may be multiple similar variables, so you can look to see which one will best suit your needs.

For Health Insurance, select:

- HICOV (Health insurance coverage recode)
- HISP (Hispanic recode)
- RAC1P (Recoded detailed race code)

For Rent Burden, select:

- GRPIP (Gross rent as a percentage of household income past 12 months)
- HISP (Hispanic recode)
- RAC1P (Recoded detailed race code)
- RELP (Relationship)

Once you have selected all relevant variables of interest, click on Step 2 on the top of the screen.

Introduction	Step1 : Select Dataset & Variable Step2 : DataBasket/Download/Make A Table
Select Data Types:	Microdata is data in which every record is at
✓ MicroData	must be added up to get the totals for each

Step 4. Next, you will recode the relevant variables for your analysis. Recoding is necessary when you want to isolate, combine, or otherwise manipulate values in a variable (e.g., if you want to combine multiple racial groups into one "Other" category). To analyze both Health Insurance and Rent Burden by race and ethnicity, you will want to recode the Hispanic recode (HISP) and Recoded detailed race code (RAC1P) variables. Select HISP and click "Recode Variable."

To analyze and save the data, copy and paste the table into Excel. You will want to focus on the race/ethnicity groups that are relevant to your analysis. In the example below, the relevant rows are White, Black, and Asian (R8, R9, R10) under the heading "Not Spanish/Hispanic/Latino," and Hispanic (R12). (*Note: You need to use the racial categories under the "Not Spanish/Hispanic/Latino" heading in order to avoid double-counting people who fall under those racial categories and are Hispanic*.) The health insurance calculation for each racial/ethnic group is the number of people with no health insurance coverage (C4), divided by the total number of people (C2), and multiplied by 100.

To analyze and save the data, copy and paste the table into Excel. You will want to focus on the race/ethnicity groups that are relevant to your analysis and the data under "Householder." (As noted above, when looking at person-level and household-level variables simultaneously, you need to analyze the data by the race/ethnicity of the householder.) In the example below, the

relevant rows are White, Black, and Asian under the "Not Spanish/Hispanic/Latino" heading, and Hispanic (R8, R9, R10, and R12). The relevant columns are C6, C7, and C9. The rent burden calculation for each racial/ethnic group is the number of rent burdened householders (C9), divided by the total number of householders minus those in the N/A column (C6-C7), and multiplied by 100.
